

Summary:

Talented worker with experience in construction, manufacturing, software and mechanical with strong problem-solving skills and the resolve to get the job done.

Highlights:

- Organized and maintains a clean working environment with a professional image.
- Clear and succinct verbal and written communication skills.
- Very safety focused with a track record of avoiding workplace injuries and accidents.
- Clean driving record; Experience driving company vehicles/trucks without incident.
- Able to work independently with the discretion to ask for help when needed.
- Innovative and fast to adapt patterns to optimize repeated tasks.
- **CDL class A** (no restrictions/manual transmission).
- Experience with forklifts, skid steer, man lifts and crane trucks.
- OSHA 10-Hour Construction Card.
- Physically fit, good at moving things and pushing through grueling labor.
- Confident working at heights (ladders/lifts/scaffolding/rooftops)

Experience:

Davis Sign. Co CNC Machinist (Nov 2023 → Nov 2025)

Operated a three axis 12'x6' CNC router table and a laser engraving booth. I worked with a wide variety of materials including acrylic, ACM, PVC, aluminum, HDU, MDF, and wood. VCarve was used to program tool paths. This job had a lot of challenging projects involving an existing product such as a weather box that I would create jigs for and find creative ways to fasten them to the table while being machined. I made sure the table was properly lubricated as well as other less important maintenance such as camera calibration, tool changes and cleaning. I would often find ways to optimize the material nesting or tool feeds/speeds to reduce wasted time and materials. Kept track of inventory and notified by boss when items needed to be restocked.

Jane's Gypsum Floors Concrete Finisher (Jun 2022 → Mar 2023)

This time at the company I mostly focused on finishing the material but also helped with the general laborer tasks outlined below. This was a very fast paced and quick thinking job as the material would set up in about 20 minutes so it was imperative that I kept a good balance of doing quality work and keeping up with the pump. This meant reacting quickly to leaks and other challenges that would arise. I ensured the material was between a minimum and maximum depth in each room as well as ensured smooth transitions between rooms. I made sure to clean splattered or spilled material to maintain a professional image for the company.

FastSigns Sign installer (Dec 2021 → May 2022)

This job was very focused on vinyl but I also helped with installing banners and dimensional signage on external and indoor surfaces. I Received training from 3M on vinyl materials, how to prepare surfaces, weed and trim and proper heat-gun and squeegee techniques. Assisted with the installation of large wall murals and applied logos (partial wraps) to vehicles including vans and commercial vehicles. I completed a lot of surveys and collaborated with various teams to create a working installation plan.

Jane's Gypsum Floors Construction Laborer (Mar 2021 → Dec 2021)

During a typical day I would set up equipment in the morning by helping unloading a bobcat and setting grout hoses from the pump to the pour site. Problem solving was required to ensure the hose could reach every area and would not double back onto wet material. During the pour I would either work outside breaking 80 pound bags of material into the mixer or shoveling sand or would work inside the building by pouring material, moving the hose, or raking material. I generally helped the pour go more smoothly by jumping in to different tasks where necessary. This was the most physically demanding job I have ever had.

NW Signs Sign installer (Jun 2020 → Feb 2021)

Installed dimensional and lit signage using a combination of ladders, lifts(boom/scissor) and crane trucks. Worked with a wide variety of signage including channel letters, monument signs, banners, interior/dimensional, wall signs and the occasional vinyl job. Assisted with Loading, transporting, and handling of signage and materials safely and without scuffing or damaging. Performed site surveys to confirm measurements, mounting surfaces, and access requirements prior to installation. Read and interpreted installation drawings, blueprints, and patterns to accurately complete jobs.

UpWork.com Full Stack Developer (Jan 2019 → Feb 2020)

Created custom websites for clients using a combination of web technologies and techniques. Managed bids and projects acquired through the UpWork platform. Provided a wide variety of services for clients from gathering requirements to establishing a domain name, and fixing existing projects. I utilized responsive and mobile-first design to create modern feeling web sites that look great on all devices. Primary technology stack consisted of: HTML/CSS, JavaScript, React, Docker, GIT, SQL/Postgres and nginx. AWS was used for hosting services, primarily Linux running on a single EC2 instance.

NW Signs CNC Machinist (Feb 2015 → Jan 2019)

This position was very similar to the Davis Sign Co job listed above with several key differences. The CNC router table used was a smaller 4'x8' model and was programmed using EnRoute instead of VCarve. I built a lot of channel letters by operating a channel bending machine and assembling and wiring the signs.
